Long-Haul COVID

People with intellectual and developmental disabilities (I/DD) are at a greater risk of infection and poorer COVID-19 related health outcomes than the general population. Differences in communication can sometimes create a hurdle to identifying and managing symptoms of COVID-19, especially for those experiencing the lasting effects of long-haul COVID.

The information provided in [Long-haul COVID Information for DSPs, Nurses, and Health Care Providers](#), [Long-haul COVID Quick Reference Guide](#), and [Long-haul COVID Information for Families and People with IDD](#) can help people experiencing lasting effects of COVID-19.
